

Air Leakage Testing for New-Build Developments

Air leakage testing is a crucial and mandatory phase of any new build development.

At Kershaw Insulation we look to make things as simple as possible, therefore we are delighted to offer a post-completion testing package as part of our service provision.

We will supply you with a quick and straight forward service, which is arranged around your build schedule. You will be provided with immediate performance results from our team on-site and we also offer remedial work if a property fails the test and guarantee NO RE-TEST FEES.

Part F Building Regulations requires standard intermittent extractor fans in new buildings (such as bathroom and kitchen extractors) to have their air flow rates measured on site and the results submitted to the building control body prior to completion.

At the same time as having the dwelling air tested we can offer at a discounted rate to test the flow rate of the extractor fans in the property. With UKAS calibrated equipment the extractor fan flow rate is quickly tested and reported on.

Introductory Offer

Air Leakage Testing : £75.00 per property

Air Leakage Testing + Extractor Fan Testing: £85.00 per property

Thermal Imaging

If you like the idea of using one provider - for an extra level of confidence, we can provide you with a thermal imaging service - which is an effective method of identifying if there are any hidden defects within a building. A proactive thermal survey can identify missed insulation along with other issues, giving you the opportunity to rectify any problems before the purchaser moves in.

Thermal Imaging: £140.00 per property
